ProjectName	MicroGoal
MaximumMarks	2Marks

ProposedSolution:

Projectteamshallfillthefollowinginformationintheproposedsolution

S.No	Parameter	Description
1	Problem Statement <i>(Problem to be solved)</i>	Many users want to manage their personal goals online, but existing systems are either insecure, unstructured, or do not provide proper user authentication and data protection. This creates risks of unauthorized access and poor goal tracking management.
2	Idea/Solution Description	The proposed solution is a secure backend API built using Node.js, Express.js, and MongoDB. It provides user registration, login with JWT authentication, and full CRUD operations for goal management. The system ensures that only authenticated users can access their own goals through protected routes and middleware.
3	Novelty / Uniqueness	The system focuses on strong security with JWT-based authentication, centralized error handling, and modular MVC architecture. It ensures user-specific data isolation, scalable backend structure, and clean RESTful API design for easy frontend integration.

4	Social Impact/Customer Satisfaction	The solution promotes secured digital goal management and protects user privacy. It increases trust in online systems by preventing unauthorized access. It also helps beginner developers understand structured backend development with real-world security implementation.
